

Strapi Requirements — Quick Summary

■ What's already done

- **Catalogues (PDFs)** — working. Tag a file's `caption = catalogue` in Media Library, it shows on site instantly.
- **Key photos** — working. Matched by filename, list is in `lib/mock/images.ts`.
- No caching/rebuild issue — anything added to Strapi shows up live right away.

■ What I need from you

1. Build these as real content types (fields below, not caption tricks):

Content type	Key fields
Case Study	slug, name, stat, statLabel, meta, image
Testimonial	quote, author, image
Certification	code, name, description
Journey Milestone	year, label
Impact Stat	value, label
Service	slug, name, category, tagline, description, image, media gallery
Product	slug, name, series, category, tagline, specs (label/value list), hero image, media gallery, catalogue link
Brand (single type)	quote, since

Full field details available if you want them — kept short here.

2. **Products & Services must use fixed category names** — 20 product categories under 6 sections, 19 service categories under 7 sections. Exact spelling is in `lib/mock/content.ts` (`PRODUCT_SECTIONS`, `SERVICE_SECTIONS`) — copy from there, don't retype.

3. **Photos/Videos tagging** — extend the same `caption` trick: `photo` for images, but **videos need a real hosting decision first** (see below) — don't just upload raw video files.

4. **Shared backend, two frontends** — since we're using one Strapi for this app + the official site:

- Separate API tokens per frontend (not shared)
- CORS allowed for both domains
- Strapi holds data only; each frontend handles its own layout

- Schema changes should be additive — no renaming/removing fields without syncing both frontend devs
- Quick check that Strapi can handle combined traffic from both

(FYI — no Strapi work needed later when I convert this to a PWA, that's frontend-only.)

■ Questions for you

- **Draft vs Published** — is Draft & Publish on, so our token only ever pulls published entries? Don't want half-edited content going live by accident.
- **Videos** — what do you recommend for hosting (Cloudflare Stream, Mux, YouTube-unlisted, something else)? Don't want raw video files sitting in Strapi.
- Anything in this list that's harder than it looks, or a better way to structure it on your end? Open to your suggestions — you know Strapi better than I do.
